Nickol, Gary Friday, June 13, 2003 3:56 PM STIC-Biotech/ChemLib 09/513365

To:

Subject:

Please search the following:

1) DNA of SEQ ID NO:2 2) DNA encoding the amino acids of SEQ ID NO:1

Thanks,

Gary Nickol CM1, AU:1642 Room 8D17, Mailbox 8E12 (703) 305-7143

Full-length enriched library was constructed using the Clontech Creator SMART kit and size-selected to contain the 1-2 kb size fraction (other fractions present in NIH_MGC_126 and NIH_MGC_128). Library created in the laboratory of T. Usdin, M.D., Ph.D. (NIMH, NIH). Note: this is a NIH_MGC_TIBLE.

First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pTTT3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  sequence tag for this library is cive.

UI-CF-ENI is a normalized cDNA library containing the
following tissue(s): Primary Lung Cystic Fibrosis
Epithelial Cells. The library was constructed according to
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TAG_SEQ-CTGCTCAGGT"

First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT73-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tags for this library are: fetal eyes, AGAATCAAGA; lens, CGATTAAGGG; eye anterior segment, AATGCGGAT; optic nerve, CCATTAAGTG; retina, CCGCG; Retina Foveal and Macular, GTCC; RPE and Choroid, ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a

UI-E-EJ1 is a subtracted cDNA library constructed
according to Bonaldo, Lennon and Soares, Genome Research,
6:791-806, 1996. First strand cDNA synthesis was primed
with an oligo-dT primer containing a Not I site. Double
stranded cDNA was ligated to an ECOR I adaptor, digested
with Not I, and cloned directionally into pT7T3-Pac
vector. The oligonucleotide used to prime the synthesis of
first-strand cDNA contains a library tag sequence that is
located between the Not I site and the (dT).B tail. The

polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-C1
library is a subtracted library derived from the UI-R-C0
library, which is a subtracted library derived from the
UI-R-A1 and UI-R-E1 libraries. The UI-R-A1 library
consisted of a mixture of individually tagged normalized
libraries constructed from rat placenta, adult lung,
brain, liver, kidney, heart, spleen, ovary, and muscle.
The UI-R-E1 library consisted of a mixture of
individually tagged normalized libraries constructed from
8, 12 and 18-day embryo. The tag is a string of 3-5
nucleotides present between the Not I site and the
oligo-dT track which allows identification of the library
of origin of a clone within the mixture. The subtracted
library (UI-R-C1) was constructed as follows: PCR
amplified cDNA inserts from UI-R-C0 clones from which 3'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Res. 6 (9),
                                                                                       ESTs had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to
               double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-C1 library. This procedure has been previously described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /clone="UI-R-C1-lc-d-10-0-UI"

TSC403 is useful in the diagnosis, investigation and treatment of cancers in which it is overexpressed, including cancer of the lung, breast, fallopian tube, oesophagus, colon, thyroid, parotid gland, bladder, ovary or pancreas. INGIL is useful in the investigation of cell proliferation, aging and apoptosis and the pathology of cancer, the diagnosis and treatment of cancer such as cancer of the colon, stomach, oesophagus or fallopian tube, and the screening of candidate drugs for the treatment of such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence represents the human tumour suppressor gene INGII The present invention also describes the human gene TSC403 expressed specifically in normal lung tissue. TSC403 is useful in the diagnosts, investigation and treatment of cancers in which it is overexpressed, including cancer of the lung, breast, fallopian tube, oesophagus, colon, thyroid, parotid gland, bladder, ovary or pancreas. INGIL is useful in the investigation of cell proliferation, aging and apoptosis and the pathology of cancer, the diagnosis and treatment of cancer such as cancer of the colon, stomach, oesophagus or fallopian tube, and the screening of candidate drugs for the treatment of such

                                                                                                                                               The present sequence is a DNA encoding tumour suppressor homologue protein, p331NG2 which is homologous to human tumour suppressor proparation. The tumour suppressors of the invention are involved in the regulation of cell proliferation and in the control of cellular aginanchorage dependence and apoptosis. The tumour suppressor protein, p471NG3, nucleic acids encoding it and antibodies against it are us for diagnosis, prevention and treatment of tumours and cancers. The p471NG3 DNA is also used in gene therapy.

The TUSUP sequence was identified from a human lung cDNA library. The protein is 240 amino acids in length and has one potential cAMP and cGMP dependent protein kinase phosphorylation site, nine potential protein kinase c phosphorylation sites, five potential casein kinase phosphorylation sites, and one potential tyrosine kinase phosphorylation sites, and chemical similarity to p33. TUSUP can be used to treat or prevent cancer, particularly of the reproductive or gastrointestinal tracts or of the immune system. Agonists of the TUSUP protein can be used to raise TUSUP specific binding agents and potential therapeutic agents. The TUSUP nucleotide sequence can be used in gene therapy and as a source of diagnostic probes and primers.

gene, each having their own promoter (la) produces a protein identical to INOI Expression of one promoter (la) produces a protein identical to INOI Expression of a second promoter (lb) produces a protein having an identical C-terminal fragment to INOI but an additional 104

CC N-terminal amino acids. The newly discovered protein has been designated p37ING1 (Wild type: p33ING1), p37ING1 has the characteristics of an oncogene. When overexpressed in cells (even those expressing wild type p53) p37ING1 is able to cause proliferation or transformation of those cells. Thus detecting a nucleic acid encoding exon 1b of ing1 by hybridisation with an included nucleic acid having the sequence of exon 1b of ing1 or its antisense sequence can identify individuals expressing the concegenic form of ing1. Novel peptide sequences taken from the 104 N-terminal peptide of p37ING1 can also be used to raise antibodies that can also be used in detection methods for the p37ING1 variant.

CC The polypeptides may be useful in gene therapy for treatment of cell produces and identify cancers and for diagnosing and concegning the sequences of expressing the sequence of expressions the sequence of expressions the sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   remains unknown but p53 has been found to act in cooperation with ING1. Functional cooperation between ING1 and p53 suggested that ING1 encoded a tumour suppressor protein that functioned within the p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its expression suggesting that ING1 was not a useful gene to study in cancer etiology. However, alternative initiation exons of the ing1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Detecting nucleic acid encoding exon 1b of ing1, useful for diagnosing and treating cancer, comprises contacting sample with isolated nucleic acid comprising sequence of exon 1b and detecting hybridized products

Expression of one promoter (la) produces a protein identical to ING1. Expression of a second promoter (lb) produces a protein having an identical C-terminal fragment to ING1 but an additional 104 N-terminal amino acids. The newly discovered protein has been designated p37ING1 (Wild type: p33ING1). p37ING1 has the characteristics of an oncogene. When overexpressed in cells (even those expressing wild type p53) p37ING1 is able to cause proliferation or transformation of those cells. Thus detecting a nucleic acid encoding exon 1b of ingl by hybridisation with an isolated nucleic acid having the sequence of exon 1b of ingl cor its antisense sequence can identify individuals expressing the oncogenic form of ingl. Novel peptide sequences taken from the 104 N-terminal peptide of p37ING1 can also be used to raise antibodies that can also be used in detection methods for the p37ING1 can also be used to raise antibodies that can also be used to useful in gene therapy for treatment of cell proliferation disorders, especially cancers and for diagnosing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 p53 pathway. This data suggested a possible role for ING1 in head and neck cancers and chromosomal location of the ING1 placed it within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its expression suggesting that ING1 was not a useful gene to study in cancer etiology. However, alternative initiation exons of the ing1 gene, each having their own promoter have been discovered.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             the p53 pathway occurs in a much larger proportion of tumours. In many cases the mechanism of functional inactivation of the p53 gene remains unknown but p53 has been found to act in cooperation with ING1. Functional cooperation between ING1 and p53 suggested that ING1 encoded a tumour suppressor protein that functioned within the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence encodes a human cancer associated antigen. The sequence is a variant of the ING1 gene, which is a tumour The sequence is a variant of the ING1 gene, which is a tumour suppressor gene candidate. The cancer associated antigen polynucleotides and polypeptides are useful for screening for the possible presence of a pathological condition in a subject such as cancer. The cancer associated antigen polypeptides are useful for producing vaccines.

cc combination, to specifically recognise epitopes of ING1 (inhibitor of CC growth 1) protein isoforms. ING1 is a tumour suppressor gene and its CC expression is regulated through the cell cycle, peaking in the S phase. CC Expression of ING1 is down regulated in breast tumours and lymphoid CC malignancies. Overexpression of a construct containing the ING1 gene is CC able to inhibit cell growth by reducing the fraction of cells which enter CC into the S phase. The monoclonal antibodies are useful for detecting an CC ING1 protein in a cell, which involves selecting a cell that ectopically or endogenously expresses ING1 protein. The anti-ING1 monoclonal antibody combination consists of two or more antibodies of CAb1-CAb10 (not two different isoforms of ING1. The antibodies are also useful for diagnosing a disease e.g. tumour or medical condition in an animal CC (preferably, human) associated with aberrant levels of an ING1 protein.

                                                                                                         CC ING1 encoded a tumour suppressor protein that functional cooperation between ING1 and p53 suggested that CC ING1 encoded a tumour suppressor protein that functioned within the CC p53 pathway. This data suggested a possible role for ING1 in head CC and neck cancers and chromosomal location of the ING1 placed it CC within a region that is frequently rearranged in head and neck cancers. Large scale analysis of tumours involving ING1 has not revealed mutations in ING1 nor significant variations in its CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 CC cancer ethology. However, alternative initiation exons of the ing1 produces a protein identical to CC cancer ethology. However, alternative find by produces a protein having CC cancer ethology. However, alternative find having the sequence can identify individuals expressing the CC content of the cancer can also be useful in gene therapy for treatment of cell CC proliferation disorders, especially cancers and for diagnosing and CC studying cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Detecting nucleic acid encoding exon 1b of ing1, useful for diagnosing and treating cancer, comprises contacting sample with isolated nucleic acid comprising sequence of exon 1b and detecting hybridized products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      p53; tumour; cancer; detection; antibody; hybridisation; exon 1b; ING1; ing1; p33ING1; p37ING1; oncogene; gene therapy; diagnosis; proliferation disorder; transformation; transformed cell; mouse;

        A partial cDNA clone (AAT69651), designated ING1, codes for a tumour suppressor protein p33ING1 (AAW1918) that is a potent inhibitor of cell growth. It was isolated by subtractive hybridisation between normal mammary and transformed epithelia cDNAs, isolation of an antisense ING1 cDNA insert that caused increased cell proliferation, and use of the insert to screen normal human fibroblast and HeLa cDNA libraries. A complete I sequence (AAT6952) was obtd. by 5'RACE. ING1 is localised to 13933-34 chromosome region, to which a number of human cancers.
                                                                                                                            Claim 1; Fig 2; 63pp;

CC performed with cDNA from normal mammary epithelial cells, and CC subtracted cDNAs were cloned into retrovirus vector pLNCX. Following passage through a packaging line, normal mouse mammary CC epithelial cells were infected, and infected cells were injected colls colls in to nude mice. Putative transforming fragments from tumours were collsolated by PCR (see AAV62290-91) and subcloned into LNCX. An ING1 cragment was obtained and used to screen normal human fibroblast collsolated collsolated collsolated in the partial ING1 sequence. The complete cDNA sequence (see CC AAV62292) was obtained by RACE. A claimed method to potentiate collsolated collsolated collsolated or an oligonucleotide encoding such as a peptide. CC alaimed method for inhibiting apoptosis in a eukaryotic cell collsolated collsolated intity in an assay for determining the apoptotic characteristics of a collsolated cell, and an isolated eukaryotic cell constantially free of p33ING1 biological activity. The invention collsolated collsolates ING1 derivatives or variants that may be used to induce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the nucleotide sequence of a human ING1 (INhibitor of Growth) partial cDNA clone that codes for a p133ING1 polypeptide (see AAW79674), a novel inhibitor of cell growth land a candidate tumour suppressor. ING1 is a new gene that is expressed in normal mammary epithelial cells, but which is expressed only at lower levels in several cancerous mammary epithelial cells in several cancerous mammary brain tumours. To isolate ING1, a subtractive hybridisation of breast cancer cell lines cDNAs was subtractive hybridisation of breast cancer cell line cDNAs was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Modulating eukaryotic apoptosis by increasing p33ING1 activity using p33ING1 derivatives, to induce apoptosis in cancer cells, in the investigation of apoptotic pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Location/Qualifiers 109..741

A partial clone (AAT69651) was isolated by subtractive hybridisation between normal command and transformed epithelial cDNAs, isolation of an antisense ING1 cDNA insert that caused increased cell proliferation, and use of the insert to screen normal human fibroblast and HeLa cDNA libraries. The complete ING1 sequence was then obtd. by 5'RACE. ING1 is localised to the 13q33-34 chromosome region, to which a number of human cancers have been mapped. ING1 nucleic acids can be used in the diagnosis of breast cancer; a decreased level of ING1 mRNA indicates cancerous cells. They can also be used in gene therapy methods to block the proliferation of cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated tumour suppressor gene, ING1 - useful to develop products for inhibiting or increasing cell proliferation, in particular for treatment or diagnosis of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI; 1997-332781/30.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              B 64
  This is the nucleotide sequence of a human ING1 (INhibitor of Growth) that codes for a pl33ING1 polypeptide (see AAW79675), a novel inhibitor of cell growth and a candidate tumour suppressor. ING1 is a new gene that is expressed in normal mammary epithelial cells, but which is expressed only at lower levels in several cancerous
                                                                                                      Modulating eukaryotic apoptosis by increasing p33ING1 using p33ING1 derivatives, to induce apoptosis in cano in the investigation of apoptotic pathways
                                                                                                                                                                                                                                                                                                                                                                                                                                                           ING1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC mammary epithelial cell lines and is not expressed in many primary CC brain tumours. To isolate ING1, a subtractive hybridisation of CC breast cancer cell line cDNAs was performed with cDNA from normal CC mammary epithelial cells, and subtracted cDNAs were cloned into CC retrovirus vector pLNCX. Following passage through a packaging CC line, normal mouse mammary epithelial cells were infected, and CC infected cells were injected into nude mice. Putative transforming CC fragments from tumours were isolated by PCR (see AAV62290-91) and CC screen normal human fibroblast and HeLa cell cDNA libraries. 2 CC clones were sequenced to obtain a partial ING1 sequence (see CC clones were sequenced to obtain a partial ING1 sequence (see CC claimed method to potentiate apoptosis in a eukaryottic cell involves administering an active p33ING1 peptide. A claimed method for CC climbibiting apoptosis in a eukaryottic cell involves administering an active passay for determining the level of p33ING1 activity in a eukaryottic cell, and an isolated eukaryottic characteristics of a eukaryottic cell, and cassay for determining the level of p33ING1 activity in a eukaryottic cell biological activity. The invention discloses ING1 derivatives or collisions that may be used to induce apoptosis in eukaryottic cancer

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                               This is the nucleotide sequence encoding the human p33-ING1 protein, cused in the method of the invention. The ING1 gene encodes p33-ING1 which can be used to modulate the activity of, isolate or detect p53. Expression of the ING1 and p53 genes in a mammalian cell results in cormal growth regulation anchorage dependent growth and apoptosis as a response to irreversible DNA damage and other cellular insult. Inhibition of expression of either gene results in a loss of cellular growth control, anchorage independent growth, inhibition of apoptosis and resistance to radiation and cytotoxic drugs. The p33-ING1 is a component of the p53 signalling pathway that cooperates with p53 in negative regulation of cell proliferation by modulating p53 dependent transcriptional activation. Biological function of p53 signalling pathway can therefore be regulated (both enhanced or suppressed) by by modulating p33-ING1 activity. The modulating p33-ING1 activity can
                                       be used for the stimulation or restoration of the p53 pathway anti cancer therapy or for the suppression of the p53 pathway defend sensitive tissues from genotoxic stress or for the gene
                                                                                                                                                                                                                                                                                                                                                                          WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                             (UNII )

                                                                                                                                                 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                            Description
